Outline

Nondeterministic Pushdown Automata

Pushdown Automata and Context-Free Languages

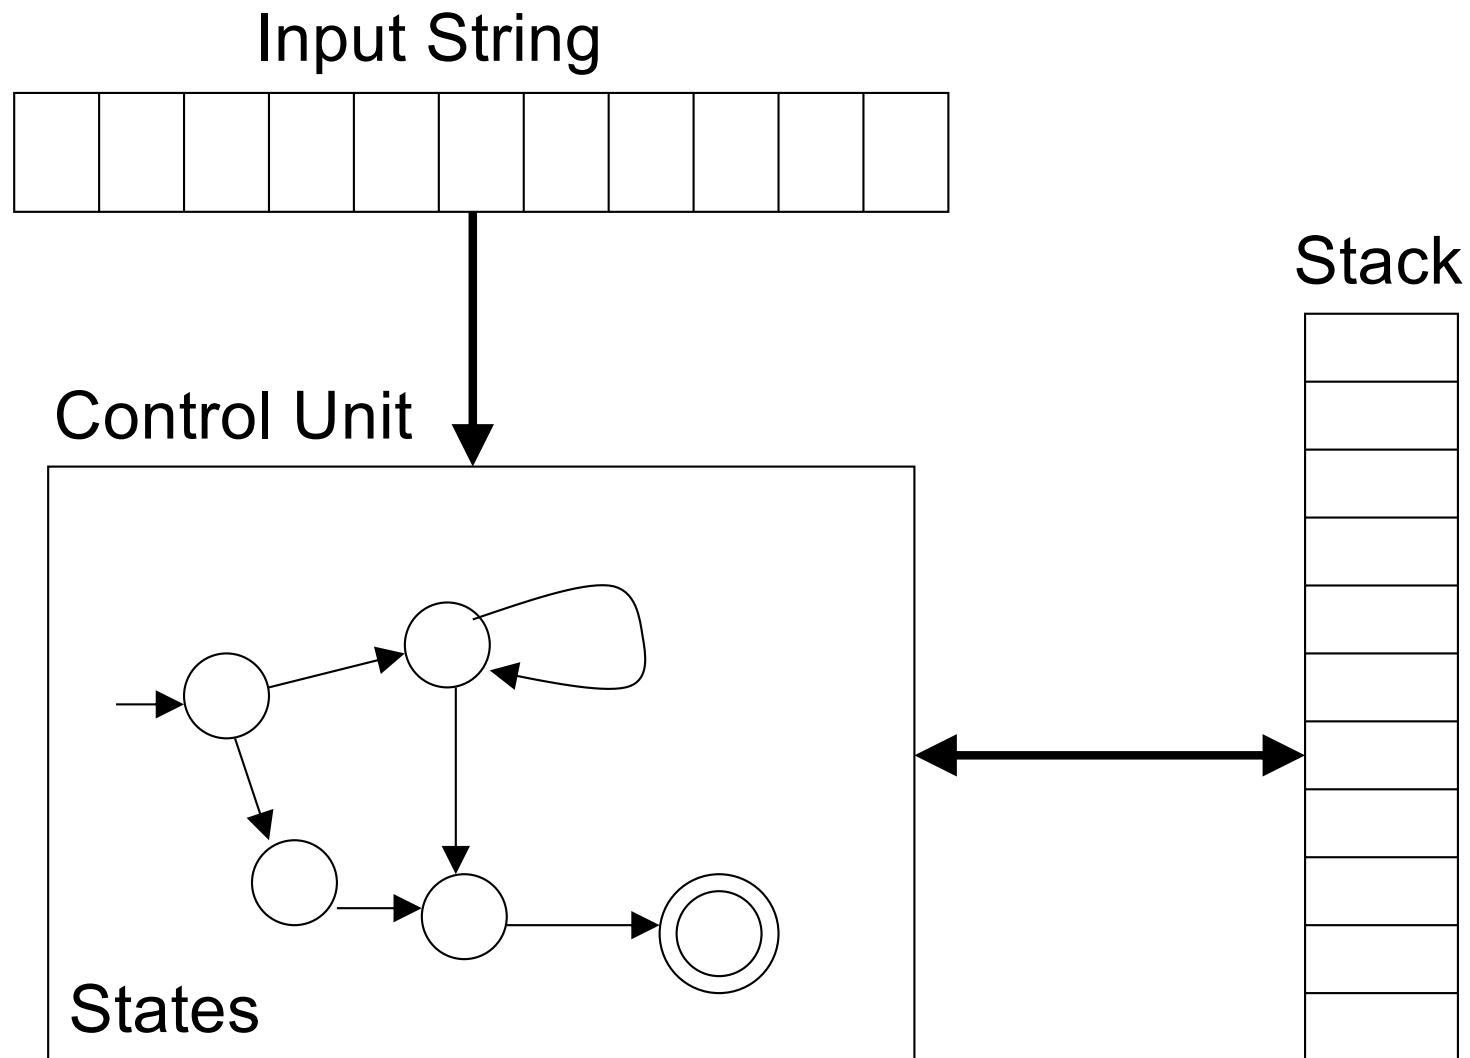

Deterministic Pushdown Automata and Deterministic CFLs

$$L = \{a^n b^n : n \geq 0\}$$

- Check all *a*'s precede the first *b*
- Count the number of *a*'s
- Count without limit
- Stack

PushDown Automata (PDA)

Pushdown Automaton -- PDA

Initial Stack Symbol

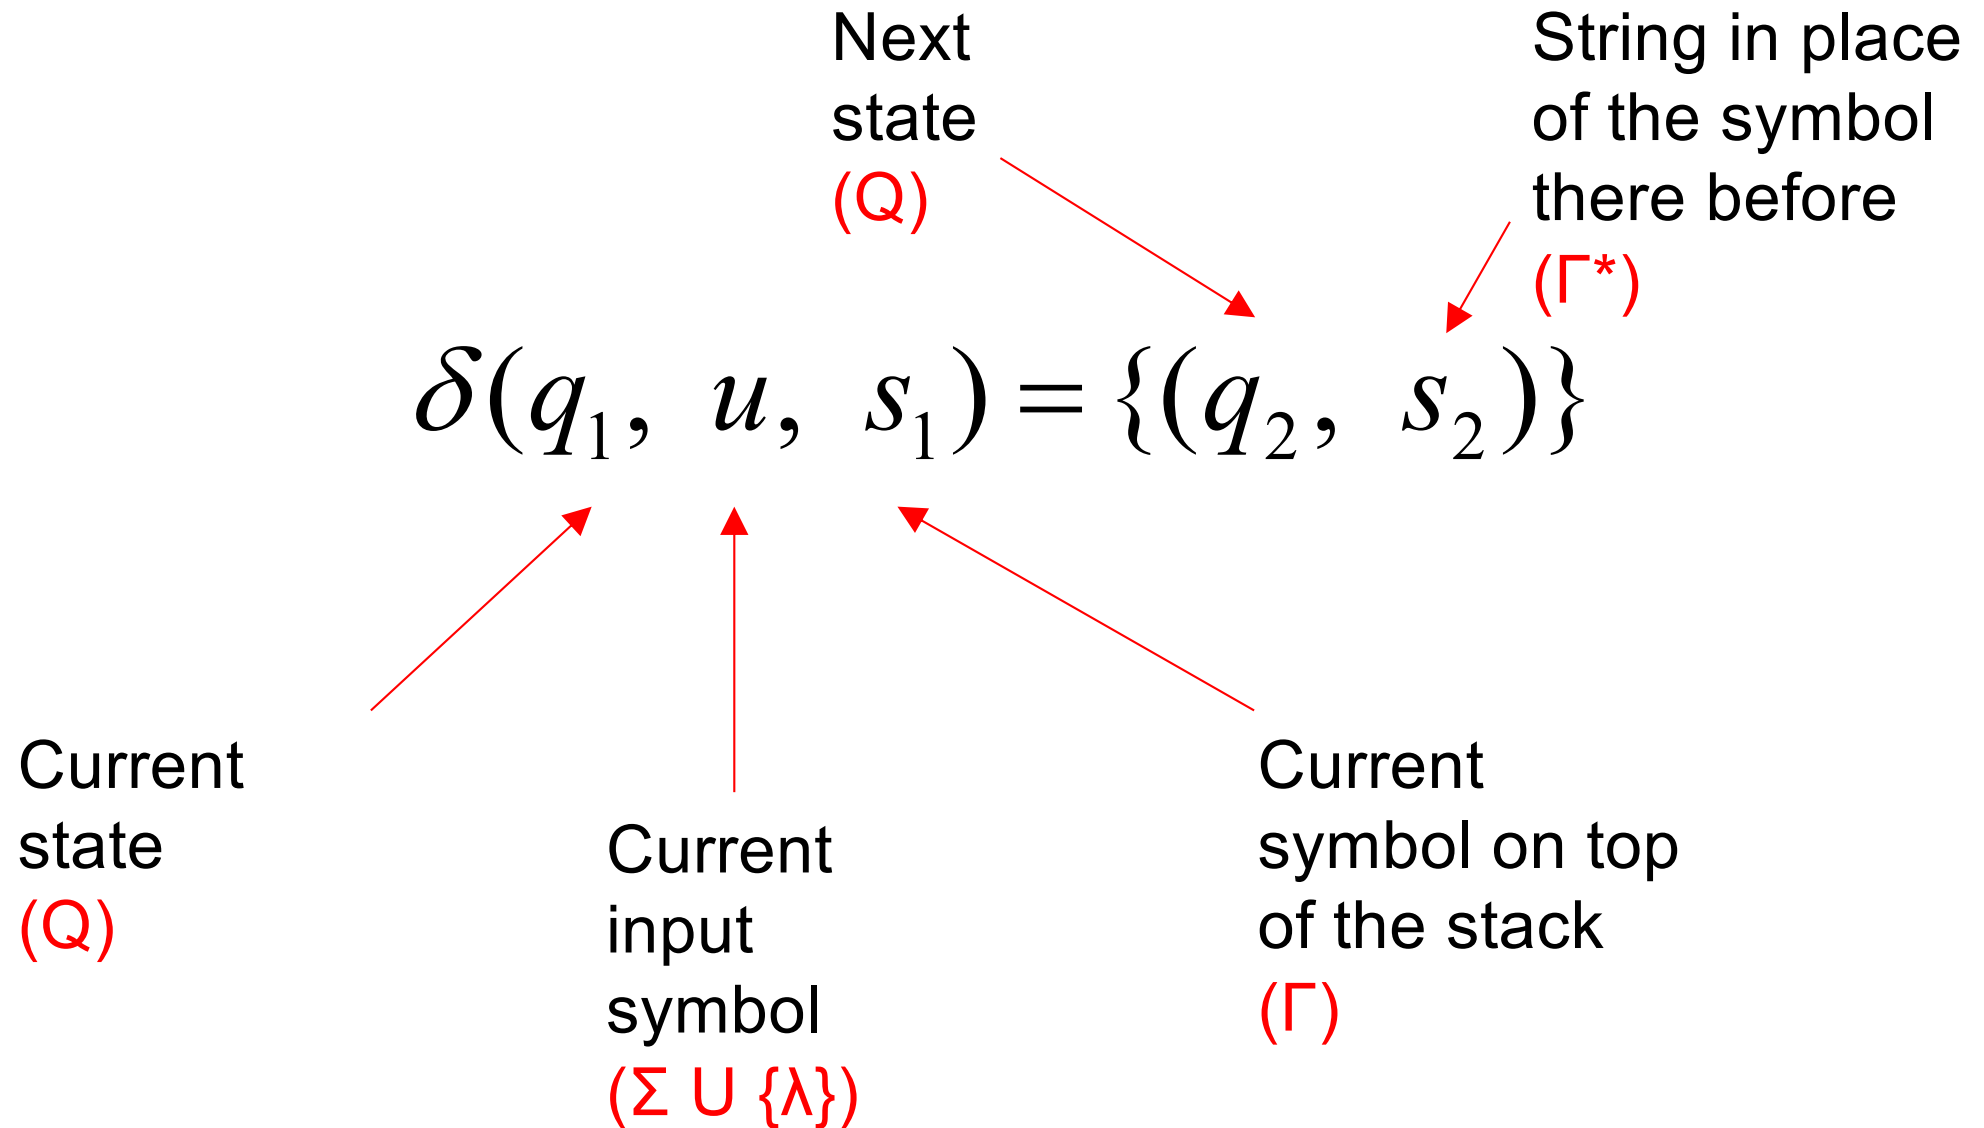

Definition 7.1

Non-Deterministic Pushdown Automaton (NPDA)

Transition Function

Labels on the Edges of Transition Graphs

$$\delta(q_1, a, b) = \{(q_2, c)\}$$

Pushing Strings

stack

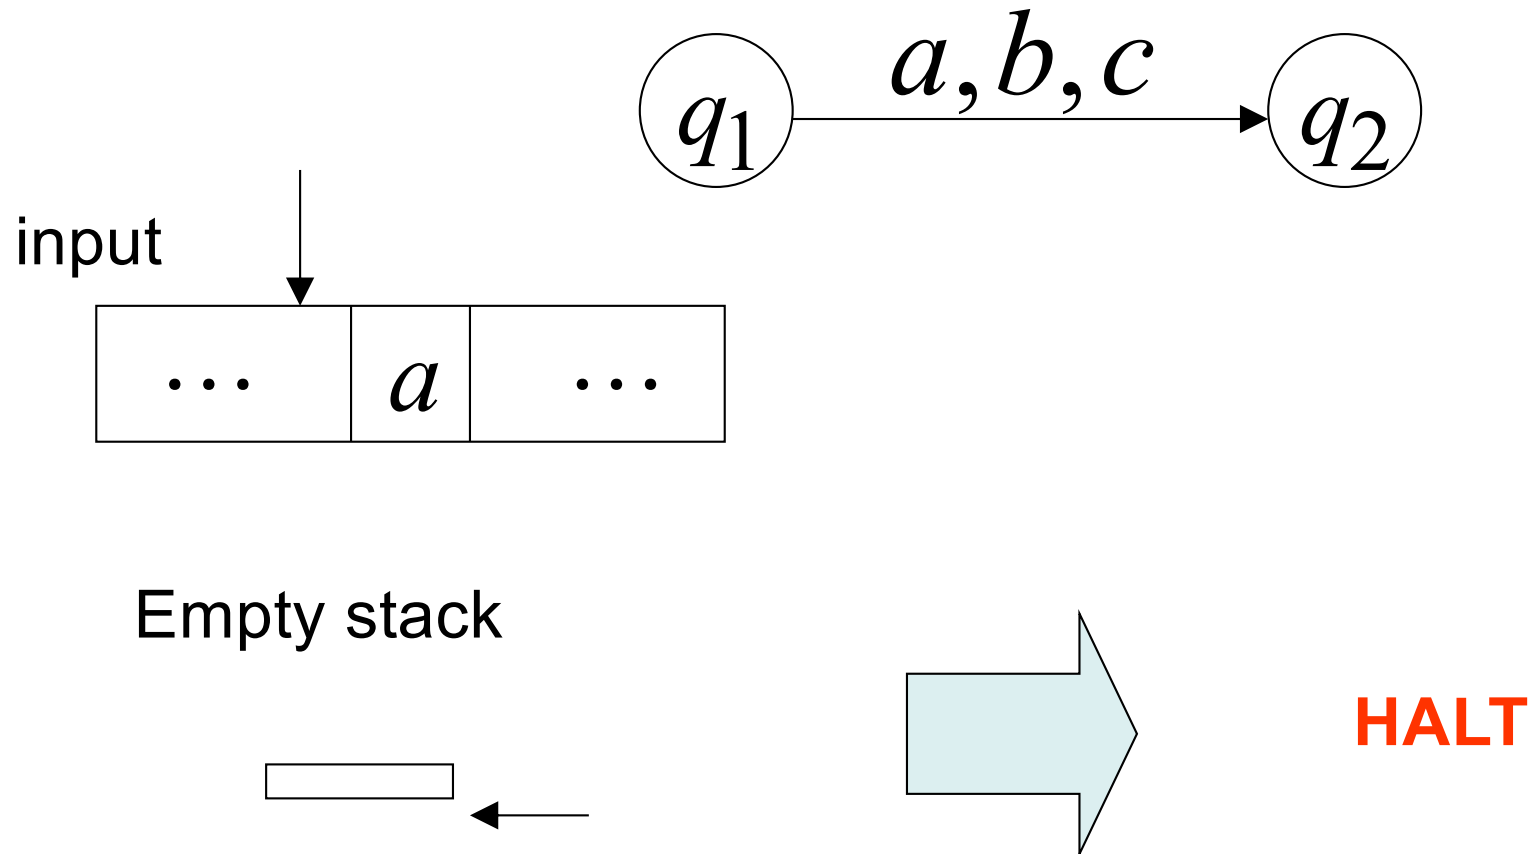

A Possible Transition

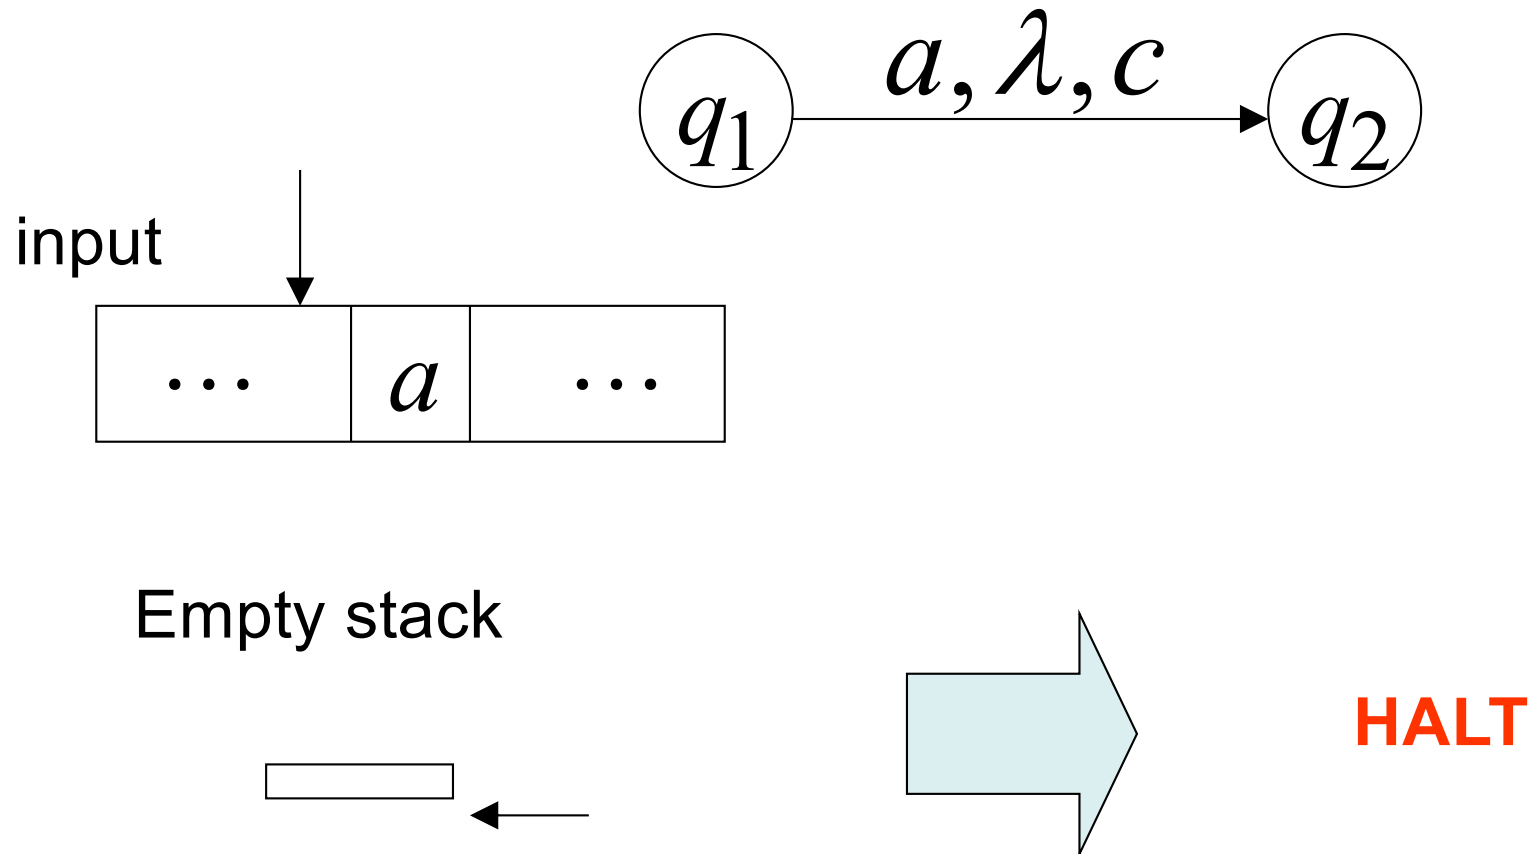

A Bad Transition

The automaton **Halts** in state q_1
and **Rejects** the input string

A Bad Transition

The automaton **Halts** in state q_1
and **Rejects** the input string

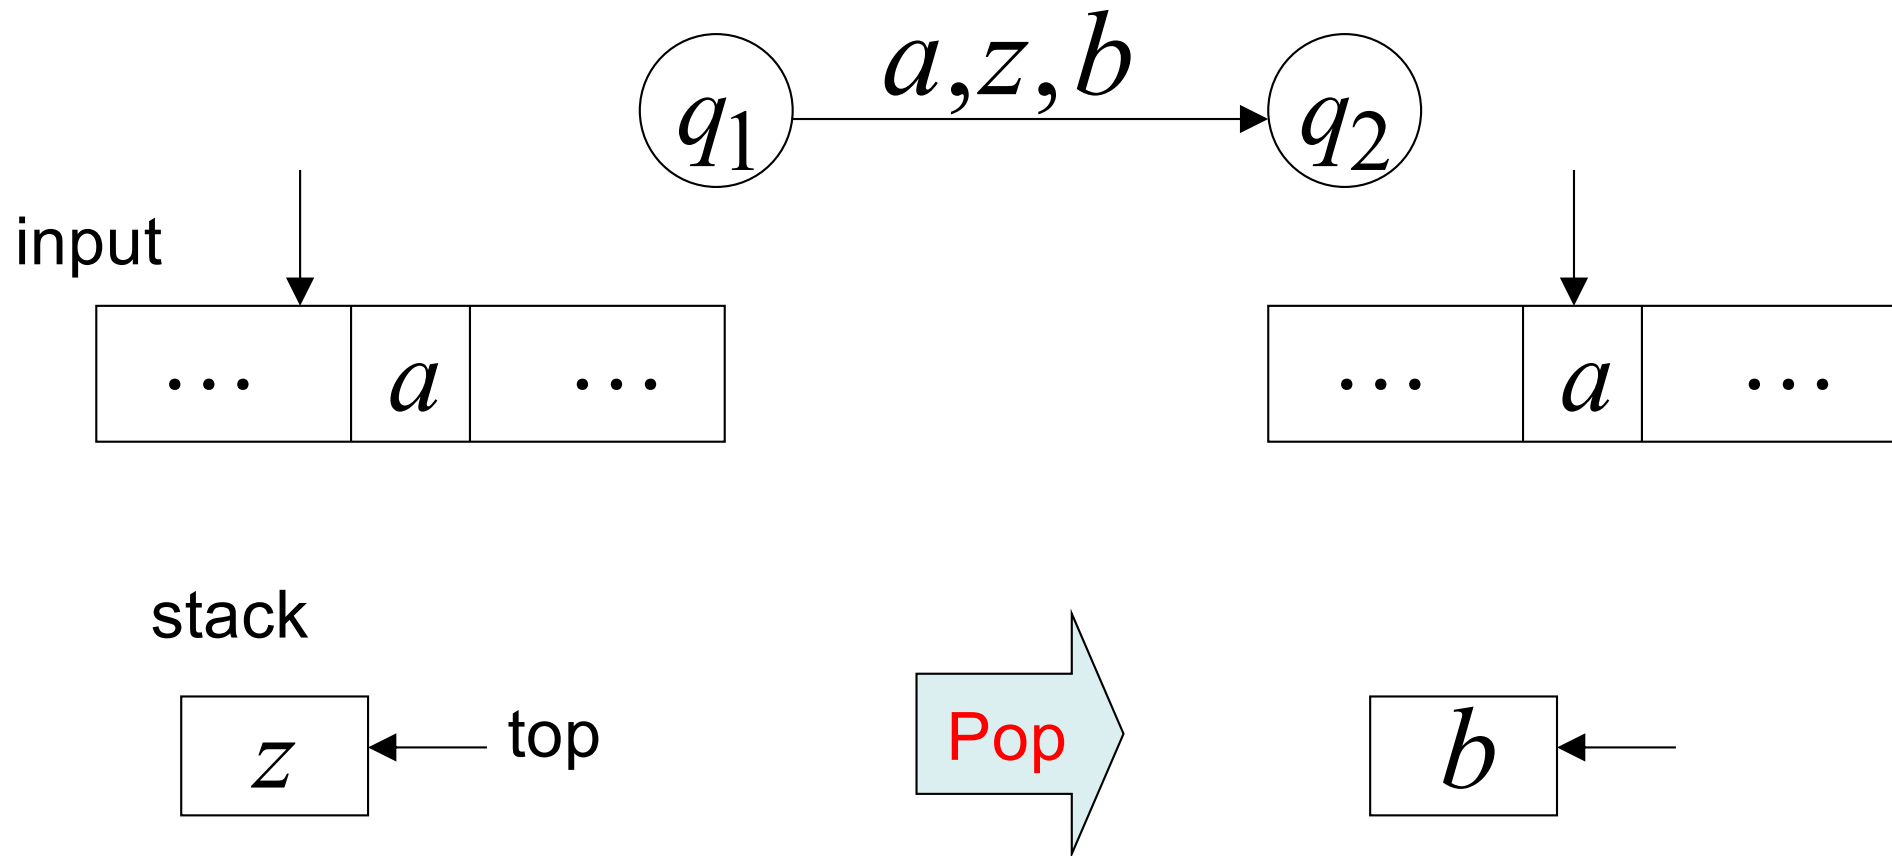

No transition is allowed to be followed
When the stack is empty

Empty stack

A Good Transition

Non-Determinism

λ – transition

These are allowed transitions in a
Non-deterministic PDA (NPDA)

Example 7.1

$$\delta(q_1, a, b) = \{(q_2, cd), (q_3, \lambda)\},$$

Example 7.2

$$L = \{a^n b^n : n \geq 0\} \cup \{a\}$$

$$Q = \{q_0, q_1, q_2, q_3\},$$

$$\Sigma = \{a, b\},$$

$$\Gamma = \{0, 1\},$$

$$z = 0,$$

$$F = \{q_3\}$$

$$\delta(q_0, a, 0) = \{(q_1, 10), (q_3, \lambda)\}$$

$$\delta(q_0, \lambda, 0) = \{(q_3, \lambda)\}$$

$$\delta(q_1, a, 1) = \{(q_1, 11)\}$$

$$\delta(q_1, b, 1) = \{(q_2, \lambda)\}$$

$$\delta(q_2, b, 1) = \{(q_2, \lambda)\}$$

$$\delta(q_2, \lambda, 0) = \{(q_3, \lambda)\}$$

$$\delta(q_0, b, 0)?$$

Nondeterministic

Example 7.3

$$L = \{a^n b^n : n \geq 0\} \cup \{a\}$$

$$\delta(q_0, a, 0) = \{(q_1, 10), (q_3, \lambda)\}$$

$$\delta(q_0, \lambda, 0) = \{(q_3, \lambda)\}$$

$$\delta(q_1, a, 1) = \{(q_1, 11)\}$$

$$\delta(q_1, b, 1) = \{(q_2, \lambda)\}$$

$$\delta(q_2, b, 1) = \{(q_2, \lambda)\}$$

$$\delta(q_2, \lambda, 0) = \{(q_3, \lambda)\}$$

Another Example

Example: $L = \{a^n b^n : n \geq 0\}$

Execution Example:

Time 0

Input

Stack

Time 1

Input

Stack

Time 2

Input

Stack

Time 3

Input

Stack

Time 4

Input

Stack

Time 5

Input

Stack

Time 6

Input

Stack

Time 7

Input

Stack

Time 8

Input

A string is accepted if there is a computation such that:

All the **input** is consumed

AND

The last state is a final state

At the end of the computation,
we do **not** care about the **stack contents**

The input string $aaabbb$
is accepted by the NPDA:

In general,

$$L = \{a^n b^n : n \geq 0\}$$

is the language accepted by the NPDA:

Instantaneous Description (ID)

Example:

Instantaneous Description

(q_1, bbb, aaz)

Time 4:

Input

Stack

Example:

Instantaneous Description

(q_2, bb, aaz)

Time 5:

Input

Stack

We write:

$$(q_1, bbb, aaaz) \circlearrowright (q_2, bb, aaz)$$

Time 4

Time 5

The symbol denotes a move from one ID to another

A computation:

$$\begin{aligned} & (q_0, aaabbbb, z) \vdash (q_1, aaabbbb, z) \vdash \\ & (q_1, aabbbb, az) \vdash (q_1, abbbb, aaz) \vdash (q_1, bbbb, aaaz) \vdash \\ & (q_2, bb, aaz) \vdash (q_2, b, az) \vdash (q_2, \lambda, z) \vdash (q_3, \lambda, z) \end{aligned}$$

$$\begin{aligned}
& (q_0, aaabbbb, z) \vdash (q_1, aaabbbb, z) \vdash \\
& (q_1, aabbbb, az) \vdash (q_1, abbbb, aaz) \vdash (q_1, bbbb, aaaz) \vdash \\
& (q_2, bb, aaz) \vdash (q_2, b, az) \vdash (q_2, \lambda, z) \vdash (q_3, \lambda, z)
\end{aligned}$$

For convenience we write:

$$(q_0, aaabbbb, z) \overset{*}{\vdash} (q_3, \lambda, z)$$

Formal Definition

Language $L(M)$ of NPDA M :

$$L(M) = \{w : (q_0, w, z) \overset{*}{\vdash} (q_f, \lambda, s)\}$$

Initial state

Final state

Example:

$$(q_0, aaabbb, z) \stackrel{*}{\vdash} (q_3, \lambda, z)$$

$$aaabbb \in L(M)$$

NPDA M :

$$(q_0, a^n b^n, z) \stackrel{*}{\vdash} (q_3, \lambda, z)$$

$$a^n b^n \in L(M)$$

NPDA M :

Therefore:

$$L(M) = \{a^n b^n : n \geq 0\}$$

NPDA M :

Example 7.4

NPDA M

$$L(M) = \{w : n_a = n_b\}$$

Stack

Order of a and b is don't care

How about more b 's than a 's
in the prefix of w ?

Example 7.4

NPDA M

$$L(M) = \{w : n_a = n_b\}$$

$a, z, 0z$ $b, z, 1z$

$a, 0, 00$ $b, 1, 11$

$a, 1, \lambda$ $b, 0, \lambda$

Single loop

Use negative counter symbol (1)

Execution Example:

Time 0

Input

$a, z, 0z$ $b, z, 1z$

$a, 0, 00$ $b, 1, 11$

$a, 1, \lambda$ $b, 0, \lambda$

Stack

current
state

Time 1

Input

$a, z, 0z$ $b, z, 1z$

$a, 0, 00$ $b, 1, 11$

$a, 1, \lambda$ $b, 0, \lambda$

Stack

Time 2

Input

$a, z, 0z$ $b, z, 1z$

$a, 0, 00$ $b, 1, 11$

$a, 1, \lambda$ $b, 0, \lambda$

Stack

Time 3

Input

$a, z, 0z$ $b, z, 1z$

$a, 0, 00$ $b, 1, 11$

$a, 1, \lambda$ $b, 0, \lambda$

Stack

Time 4

Input

$a, z, 0z$ $b, z, 1z$

$a, 0, 00$ $b, 1, 11$

$a, 1, \lambda$ $b, 0, \lambda$

Stack

Time 5

Input

$a, z, 0z$ $b, z, 1z$

$a, 0, 00$ $b, 1, 11$

$a, 1, \lambda$ $b, 0, \lambda$

Stack

Time 6

Input

$a, z, 0z$ $b, z, 1z$

$a, 0, 00$ $b, 1, 11$

$a, 1, \lambda$ $b, 0, \lambda$

Stack

Time 7

Input

$a, z, 0z$ $b, z, 1z$

$a, 0, 00$ $b, 1, 11$

$a, 1, \lambda$ $b, 0, \lambda$

Stack

Example 7.5

NPDA M

$$L(M) = \{ww^R\}$$

How do we know the middle of the string?

Execution Example:

Time 0

Input

Stack

a, λ, a
 b, λ, b

a, a, λ
 b, b, λ

Time 1

Input

Stack

Time 2

Input

Stack

Time 3

Input

Guess the middle
of string

Stack

Time 4

Input

Stack

Time 5

Input

Stack

Time 6

Input

Stack

a, λ, a
 b, λ, b

a, a, λ
 b, b, λ

Rejection Example:

Time 0

Input

Stack

a, λ, a
 b, λ, b

a, a, λ
 b, b, λ

Time 1

Input

Stack

Time 2

Input

Stack

Time 3

Input

Guess the middle
of string

Stack

Time 4

Input

Stack

Time 5

Input

There is no possible transition.

Input is not consumed

Stack

Another computation on same string:

Input

Time 0

Stack

a, λ, a

b, λ, b

a, a, λ

b, b, λ

$\lambda, \lambda, \lambda$

λ, z, z

Time 1

Input

Stack

Time 2

Input

Stack

Time 3

Input

Stack

Time 4

Input

Stack

Time 5

Input

No final state
is reached

Stack

a, λ, a
 b, λ, b

a, a, λ
 b, b, λ

There is no computation
that accepts string $abbb$

$$abbb \notin L(M)$$

A string is rejected if there is
NO computation such that:

All the input is consumed
AND

The last state is a final state

At the end of the computation,
we do not care about the stack contents

In other words, a string is rejected
if in every computation with this string:

The input cannot be consumed

OR

The input is consumed and the
last state is not a final state

OR

The stack head moves below the
bottom of the stack

Another NPDA example

NPDA M

$$L(M) = \{a^n b^m : n \geq m - 1\}$$

?

Another NPDA example

NPDA M

$$L(M) = \{a^n b^m : n \geq m - 1\}$$

$$n = m$$

$$n \geq (m - 1) \text{ is true}$$

Another NPDA example

NPDA M

$$L(M) = \{a^n b^m : n \geq m - 1\}$$

$$n = m - 1$$

$n \geq (m - 1)$ is true

Another NPDA example

NPDA M

$$L(M) = \{a^n b^m : n \geq m - 1\}$$

$$n \geq (m + 1)$$

$n \geq (m - 1)$ is true

Questions?

Quiz

- $L = \{wcw^R : w \in \{a,b\}^*\}$
- $L = \{a^n b^m c^{n+m} : n \geq 0, m \geq 0\}$
